Product Checklist

The following items are included:

- Key Chain Digital Tire Pressure Gauge

Getting Started

1. Press the ON button. Wait for either '0.0' PSI or '0.00' BAR to be displayed upon the LCD screen. (Note: the ON button can be pressed to change the unit measurement).
2. Place the gauge's nozzle onto your tire valve. Make sure a good seal is made between the nozzle and the valve stem so that no hissing sound (i.e. the sound of air escaping) is heard.
3. Hold the gauge on the valve stem until a reading locks on the LCD display.
4. Promptly remove the gauge from the valve stem and read the pressure.
5. Hold the ON button for 2-3 seconds to clear the reading and begin another measurement.
6. Holding the ON button for 6 seconds will shut down the gauge.
7. The gauge will auto shut down after 30 seconds if there is no operation.

Notes

- If you observe an unusually high/low reading, make sure no sound of air escaping is heard. Also, make sure you are checking the pressure on cool tires, i.e. those that have not been driven around for several hours.
- Be sure to follow tire manufacturers' recommended pressure ratings which are based on 'cool' tire temperatures.
- The electronic module and power cell are factory sealed within the unit. There are no user serviceable parts.
- To clean the gauge, use a soft damp cloth. Do not immerse in, or spray with water or liquid cleaner.
